1 Handcoded TikZ Figures

This is a figure from a previous chapter I wrote for my educational curriculum job to describe a circular motion of a billiard ball bound to a string.

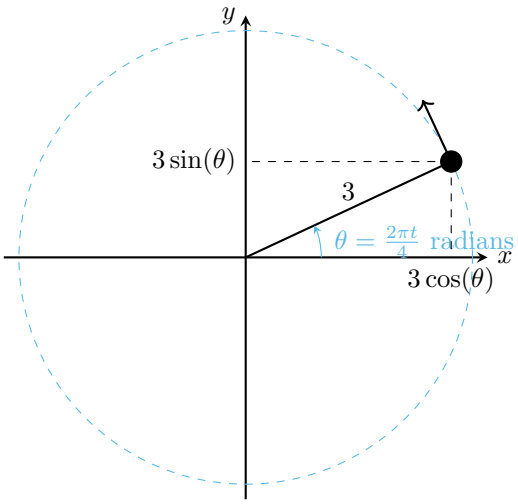

Figure 1: A diagram of our ball and string scenario.

This is a diagram I drew a while back for describing the FBD of a box on an inclined plane.

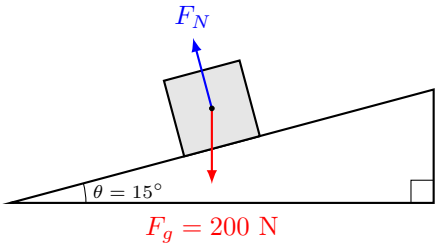

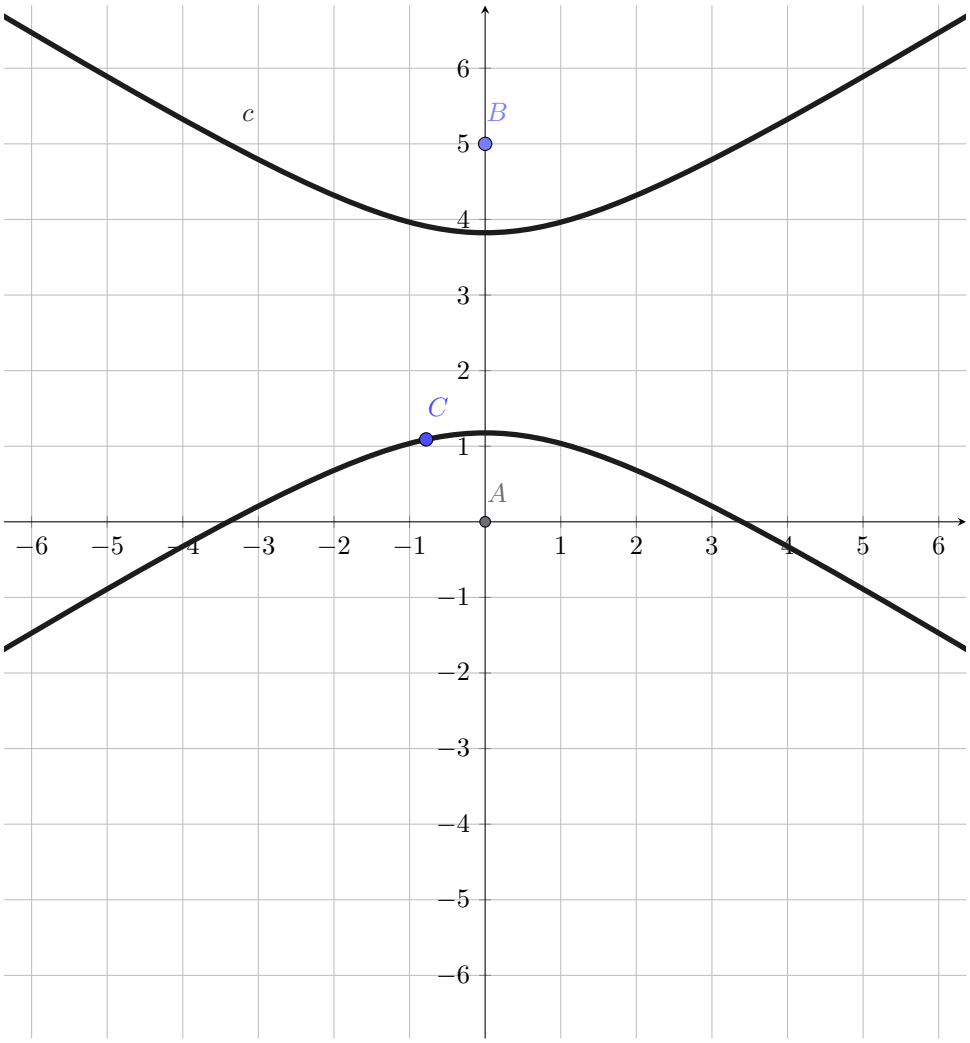

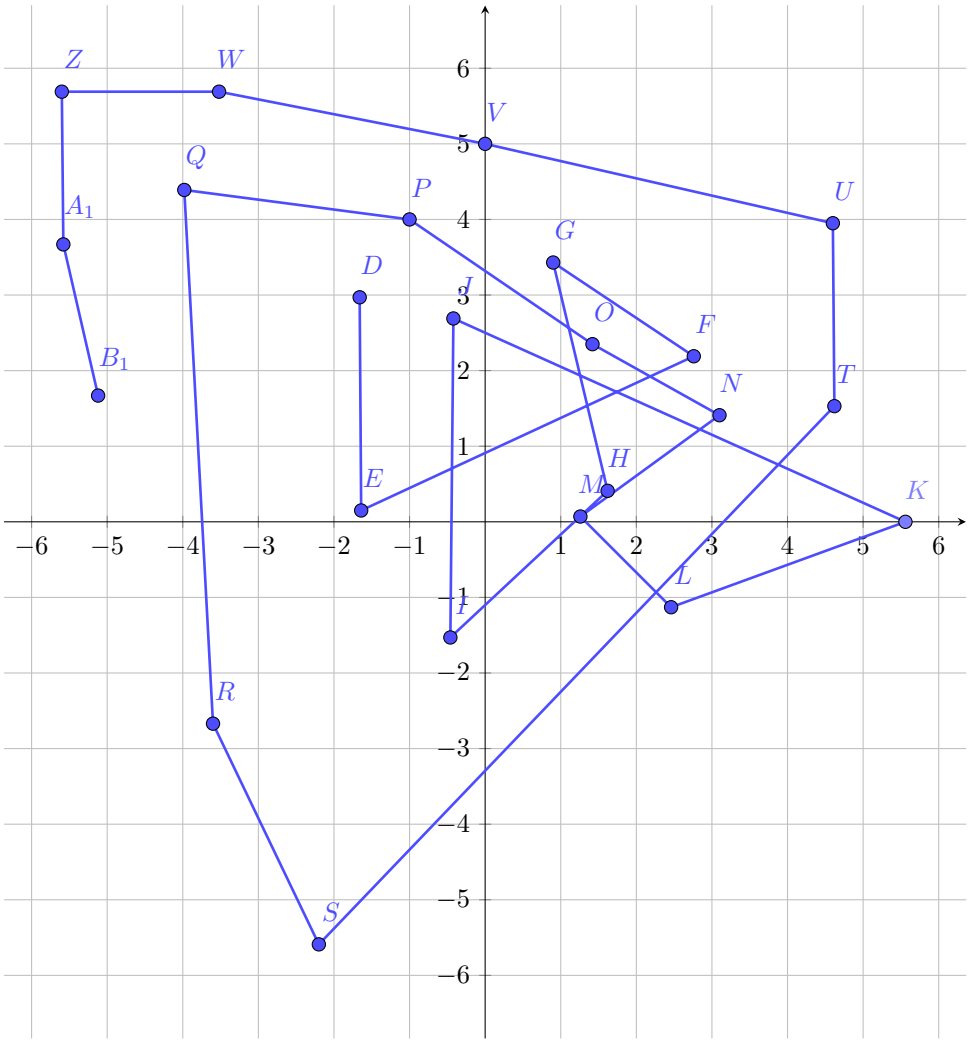

Figure 2: A box sits on a 15° inclined plane. A gravitational force of 200 N acts downward while a normal force acts perpendicular to the surface. The ultimate goal of this problem is to figure out the net force acting on the box along the incline.

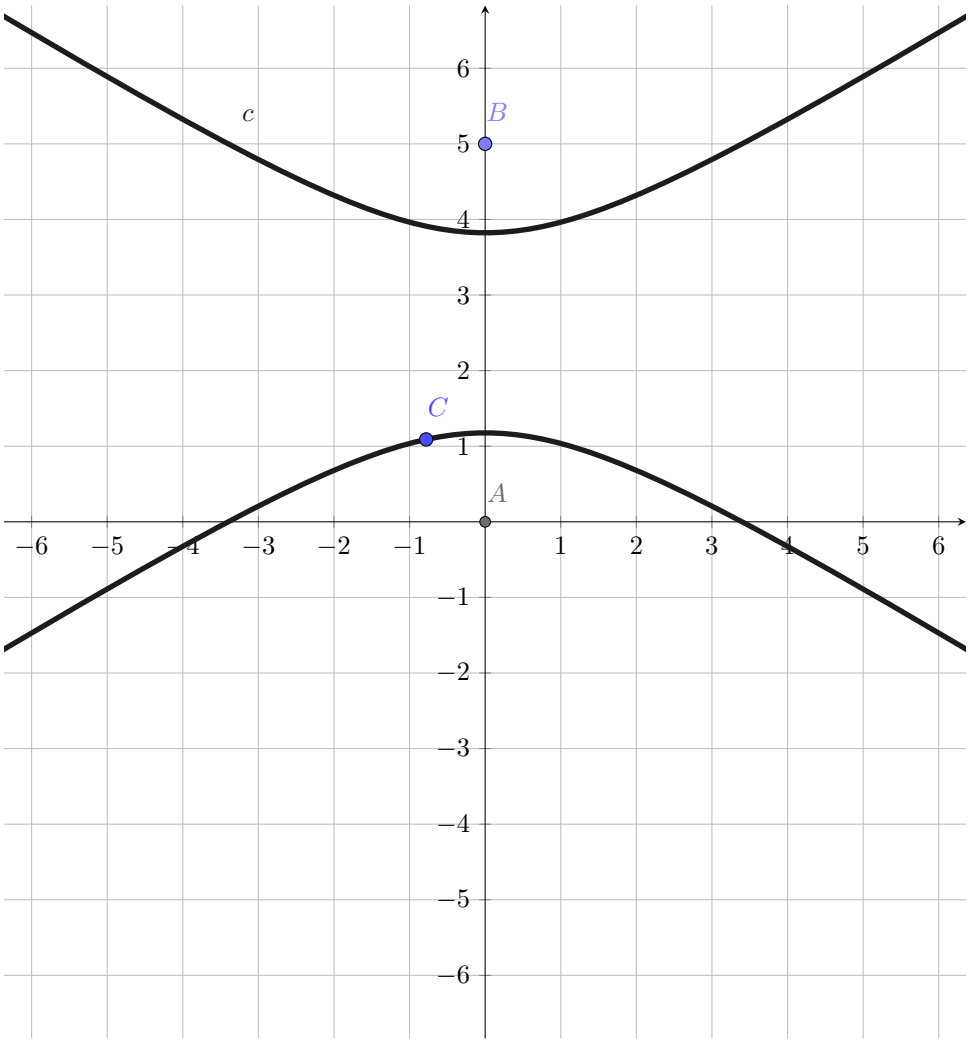

2 Geogebra generated ones

I moved the library and color def stuff up to the preamble for better organization.

This is a figure with a 12-sided polygon, semi circle, and conic.

Future improvements could include shrinking the grid sizes, adding labels to all points and curves, improving the color scheme for better visibility, and possibly adding interactive elements for dynamic visualization.
